

~~# main string function :-~~

mysql [structured query language]

Tuple :- rows of tables

Attribute :- columns of tables

degree :- no. of attributes (columns)

cardinality :- The no. of tuples (rows)

keys:-

* Primary key :- A primary key is a set of one or more attributes that can uniquely identify tuples within the relation.

* Composite primary key :- When primary key is made up of two or more attributes. (column)

* Candidate keys:-

All attribute combination inside a relation that can serve as primary key are candidate keys.

* Alternate key :-

A candidate key that is not the primary key.

* Foreign key: A non-key attribute whose values are derived from the primary key of some other table. It is called foreign key.

(DDL) [Data definition language]

operations:- create, alter, drop, rename,

Truncate etc...

(DML) [Data manipulation language]

operations:- select, update, delete, insert,

lock etc...

Data types:-

- * INT, TINYINT, SMALLINT, BIGINT, FLOAT (m,D)
- * DOUBLE (m,D), DECIMAL (m,D), MEDIUMINT
- * CHAR (m), VARCHAR (m), BLOB, BINARY, VARBINARY
- * DATE: - YYYY-MM-DD [format]
- * DATETIME: - YYYY-MM-DD HH:MM:SS [format]
- * TIME: - HH:MM:SS [format]
- * SET (m), ENUM (m)

* DATE: - YYYY-MM-DD [format]

DATETIME: - YYYY-MM-DD HH:MM:SS [format]

* CHAR (m):
length

* VARCHAR (m):
length

| | |
|--------|-------------|
| length | min. m. col |
| length | 255 |

Clauses :- Commands consist of one or more logically distinct parts called clauses.

Example:- "The input below is valid:
 FROM salz"
 ↓ ↓
 From, [Arguments] (100)
 clauses

Queries :- Simple commands :-

- * Create database anime;
 - * Show databases;
 - * Use anime; [use (<database name>);] drop a database;
 - * Create table <table name>(<column name> <datatype> [size] [key name])
- example:-
 [format] 22:11:11 11-MM-YYYY : DATE
 -> create table DBS (name varchar(20),
 id int (primary key))
- * Show tables;
- | | |
|----------------|-----|
| Table-in-anime | DBS |
|----------------|-----|

* Select <column name>, [<column name>, ...] From
 <table name>;

ex:-

| | | | |
|------|---|---|------|
| Ex:- | + | F | : 09 |
|------|---|---|------|

Select name, owner from sys;

* Select * from <table name>; or select All from
 <table name>;

| | | | |
|------|---|---|------|
| Ex:- | + | F | : 09 |
|------|---|---|------|

Select * from DBS;

* Select Distinct <column name> from <table name>;

Ex:-

Select Distinct age from DBS;

key point:- only one Null value is returned.

* DESCRIBE | DESC <table name>;

Ex:-

DESC DBS;

+-----+-----+-----+-----+
 | field | type | null | key | Default | Extra |

| id | int(11) | no | auto_increment | |

| name | varchar(20) |

| student table |

| auto increment |

| primary key |

| name |

[60, 10, 11, 12, 14 not null]

* Calculation commands:-

select 1+6;

ex:

| |
|-------|
| 1 + 6 |
| ----- |
| 7 |

<answer>

most likely

select 4*3 from dual;

dummy table

<answer>

output:-

; 2nd mark * will

| |
|-------|
| 4*3 |
| ----- |
| 12 |

known as
provided by
mysqld.

which contain
only one row one
column.

* current date:-

select curdate();

{curdate() }
{ 2009-05-03 }

* scalar expressions:-

select age+10 from obs;

[add operation]

add 10 to
each value in
that column

[only for (+), (-), (1), (*), (%)]

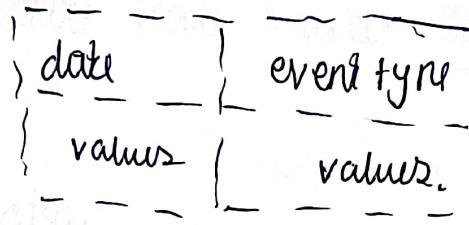

if Null then,
it return,
null

* column aliases:

`Select <column.name> As "Alias name" from
dbs;`

ex:-

`Select date, type as "event type" from
event;`

also,

`Select 1+3 as "sum" from dual;`

* Null matching op:-

| Sum |
|-----|
| 7 |

+ double quotes
is used only for
more than one word

* Handling nulls:-

`Select <column.name>, Ifnull(<column.name>, value)
from dbs;`

ex:-

(I) Output (BB) DATA, (II) ID

`Select name, Ifnull(Id, 001)`

value output
if value is
null

Output displaying more three values as "Id-Id".

`i('23'-bb) from dbs; j(23'-bb)`

| name | Id - Id |
|-------|---------|
| value | 001 |

* putting that in the query output: (values module)

merg select name, age, "%" as module from
Dbs;

merg "input Davis" s
op:-

| name | age | module |
|--------|--------|--------|
| values | values | % -- |
| Davis | 20 | --- |

* where - clause:-

Select <column-name>, <column.name>, from
<table-name>. where <condition>;

| | |
|-----|-----|
| MWE | :90 |
|-----|-----|

ex: student select name, F.aggroure from student
where aggregate > 350;

relational operator :- < > = <= >= !=

(and, or, not) [<= > <= > <= >]

logical operator:-

OR (||), AND (&&); NOT (!)

and, or, not

but

ex:- (10, 20) will be union like value in

"bitwise" select ename, grade from employee where
(grade = 'E2' || grade = 'E3');

* select ecode, ename, grade, age gross
from employee where (grade = 'E4') and gross < 400;

* Select iode, ename from employee where
(NOT grade > 'G1');

* Condition Based on a Range [Between] Juse

→ select iode, dscrp from items
where iode between 30 and 50;

Subiect: more stopwro, uner tubo
also, NOT between.

* pattern matches;

→ 'san%' string beginning with 'san'

→ '%idge%' string containing 'idge' ex: 'Ridgi'
matches string exactly 4 characters
→ '_dov%', matches any string of at least
3 characters.

example:-

→ select firstname, lastname, city from
members where pin like '13%';

→ Select name from emp where name
like '%oy';

→ select firstname, city from members
where pin NOT like '13%';

Select * from student where name like "%";

* Sorting [order by clause]

Select <column names> from <table name>

Order by <column name> ASC | DESC
ASC is default

order by is optional

ex:-

Select name, aggregate from student

where aggregate > 400 order by name;

optional
default
ASC

* Aggregate functions:

use min, max, sum, avg, count

AVG()

syntax: select AVG(column) from <table>
SELECT AVG([DISTINCT] ALL), column
from <table>;

COUNT():

syntax: SELECT COUNT([*] [DISTINCT] ALL) [column]
from <table>;

max():

Select max(DISTINCT ALL column)
from <table>;

min():-

Select min(DISTINCT | ALL column)
from <Table>;

use for (as) returning union with idat stand

sum():-

Select sum(DISTINCT | ALL column)
from <Table>;

Count(<column name>) | count(*)

| | |
|---------------------|-----------------|
| if not include null | if include null |
|---------------------|-----------------|

use for (as) returning union with idat stand

* removing data base:

use for DROP database <data base name>;

ex:-
Drop database dok;

* Different constraints:-

1) constraint (as) constraint is a condition or

2) which applicable on a field or set of fields.

* constraint
→ unique constraint

→ primary key constraint

→ default constraint when on fi

→ check constraint. d. will not

foreign key constraint. b. idat stand

: ("Rof" stand)

* Unique constraint :- [each column constrain only one null & no values repeated]

ex:-

Create Table Soki (name varchar(20), Id INT
NOT NULL UNIQUE);

(name) unique constraint make ↓
↓
< id > more no null value constraints

* primary key constraint :-

(+) rows [primary key can't allow null value]

| | |
|----------------|--------------------|
| one student -> | one student for -> |
|----------------|--------------------|

ex:-

Create Table Soki (name varchar(20), Id INT primary
key);

also, primary key constraint can set for

two columns

Create Table Soki (f-name varchar(20), l-name
varchar(20), primary key (f-name, l-name));

* Default constraint:

if no value is specified then, Default
value will be used.

Create Table Soki (name varchar(20), text varchar(20),
Default "fair");

* check constraint:- [does guideline meet what using?]

ex:-

create table employee (ename varchar(20),
pcode integer, gross decimal check
constraint (gross > 2000));

* foreign key constraint:-

[using primary key as reference
from other table to the current table]

ex:-

create table items [parent table]
; ('kif', Itemno char(5) NOT NULL primary key);

create table orders

Customer (orderno Number(6,0) NOT NULL primary key,
Itemno char(5) References items (Itemno));

So how many based

on this primary key
parent table of parent table

* (optional)

constraint < new-name > < constraint >

ex:-

(Kaz, Unisa, Onisa) karo oñi buri
create table loki (name varchar(20) constraint
p-key primary key);

* Create table from existing table:-

(columns in create Table and item AS
about LOKI. Select code, disp
(Codes < 1000) from items.
where QOH < ROL
);

Output: Go for printing option]

* SHOW columns from <table-name>;

* Inserting values: [insert] small insert into

(for printing value type (2) for printing)
Insert into loki values('101', 'fail');

also,

for printing value type (0,1) normally on printing
Insert into loki (name, result) values
(name, result);

we can specify the
column, if column was
missed null will be
updated.

INERT INTO <Table-name> Select * from
branch2 where gross > 7000.00;

ex:-

inser into emp(emplno, ename, sal)
select enum, Ename, sal
from Temp
where month >= 24;

* update command : (update always come with set keyword)

update <table name> set <condition to be
changed ad new value> where <to the condition>

ex:- update items

set ROL = 250;

->* update items

set ROL = 250, WHI = 100 WHERE

where PROD < 'I040';

->* update employee

set gross = gross + 900;

* Deleting Data from Table

delete from items;

or

delete data but table is

not there

Ex:-

delete from employee

where gross < 2200;

first the error will come

error comes

as no record

* DROP TABLE:-

(Drop table)

Drop table 'Items';

SQL statement > SQL query > Database

Additional int of > query, table existence will be erased

* ALTER TABLE:-

When doing this query - SQL

SQL = SQL query

-> Adding columns:-

Ex:-

ALTER table 'Items' Add (Pnum int);

Input : Add new column

-> modifying column definitions:-

* datatypes & size

* Default values

* integrity constraints

* Order of columns

Ex:-

ALTER TABLE Emply

modify (Job char(30));

-> changing

size of datatype

also,

ALTER TABLE Assignment

modify · PROJID INT FIRST;

L,

changing column
position in 1st

-> changing column name;

ALTER TABLE <TABLE NAME>

change <old-column> <new-column>
<datatype-size>;

Ex:-

Alter table customers change first-name
firstname varchar(20);

-> Removing table components:-

Alter table customers drop primary key,
drop default, drop column first-name;

* Rename table:-

Rename <oldtablename> to <newtablename>

| | | |
|-----|----------|-----|
| (*) | customer | 100 |
| 100 | John | 325 |
| 101 | Jane | 325 |
| 102 | Smith | 325 |

* GROUP - BY :-

SELECT Job, count(*)
 from empl
 GROUP BY Job;

| Job | count(*) |
|------|----------|
| CSE | 3 |
| AIDS | 2 |
| AIML | 4 |

also,

SELECT Job, sum(sal)
 from empl.
 GROUP BY Job;

| Job | sum(sal) |
|------|----------|
| CSE | 50L |
| AIDS | 40L |
| AIML | 60L |

if,

SELECT Job, name
 from empl.
 GROUP BY Job;

| Job | name |
|------|------|
| CSE | LOKI |
| AIDS | AKI |
| AIML | MKI |

Random name.

* GROUP - HAVING clause

SELECT Job, count(*)
 from empl
 GROUP BY Job
 HAVING count(*) < 3;

| Job | count(*) |
|------|----------|
| CSE | |
| AIDS | 2 |

* JOIN :- Select attribute from one table & attribute from another table

Ex. Same Table - A1 AND Table - A2

[common column - s_id]

| s_id | s_name | age | dob | marks |
|------|----------|-----|------------|-------|
| 1 | goku | 18 | 2007-03-20 | 98 |
| 2 | luffy | 19 | 2006-04-22 | 97 |
| 3 | zoro | 18 | 2007-01-22 | 96 |
| 4 | jinwoo | 19 | 2006-03-22 | 98 |
| 5 | eren | 18 | 2007-06-12 | 100 |
| 6 | mydoriya | 18 | 2007-03-22 | 97 |

another

(this) (A) similar relation - result will give fruit

s_id city

| | |
|---|-------------|
| 1 | chennai |
| 2 | Kanchipuram |
| 3 | Thiruvallur |
| 4 | chennai |
| 5 | Chithabaram |
| 6 | erode |

so,

1. Select s.s_id, s.s_name, a.city from Students

as s JOIN stu_location as a where

s.s_id = a.s_id;

we can use
"on" also

2. Select s.s_id, s.s_name, a.city from Students

as s INNER JOIN stu_location as a where

s.s_id = a.s_id;

3. Let's add one row in studentz table :- [3 only]

insert into studentz values (8, 'JATI', 'som', 18,
E01 - 2007-05-21, 100);

Select s.s_id, s.s_name, a.city from
studentz as s left join stu-location as
a on s.s_id = a.s_id;
↳ only "on" not where.

4. Let's add one row in stu-location table:-

insert into stu-location values (6, 'erode');

Select s.s_id, s.s_name, a.city from
studentz as s right join stu-location as
a on s.s_id = a.s_id;
↳ only "on" not where.

5. combine mark phd, min_2, bi_2 by
Select * from studentz, stu-location order by
studentz.s_id;

verb "no"
studentz mark phd, min_2, bi_2
with no as residual-ite with min_2
(bi_2.p = bi_2.p)

output:

1. 5-id
+ student table
student

2. 3-id

3. 4

4. student

5. 5

6. student

7. student

8. student

9. student

10. student

| s_id | s-name | city |
|------|---------|-------------|
| 1 | goku | chennai |
| 2 | uffy | Kanchipuram |
| 3 | zoro | Thiruvallur |
| 4 | JINWOO | chennai |
| 5 | ern | cithabaram |
| 6 | mydoria | erode |
| 7 | som | null |

Show only related rows of

each rows
of two tables

2. same output no difference

~~error null value p bnpidca s0 null~~

3. student

s_id s-name city

| | | |
|---|---------|-------------|
| 1 | goku | chennai |
| 2 | uffy | Kanchipuram |
| 3 | zoro | Thiruvallur |
| 4 | JINWOO | chennai |
| 5 | ern | cithabaram |
| 6 | mydoria | erode |
| 7 | som | null |

null

↳ null assigned

d. Show full rows in
students table

5. one row of student is connected with
all rows of stu-location table.

so,

$$\text{total no. of rows} = 6 \times 6 = 36$$

| <u>s_id</u> | <u>s_name</u> | <u>city</u> |
|-------------|---------------|-------------|
| 4 | goku | chennai |
| 5 | lufty | Kanchipuram |
| 6 | zoro | Thiruvallur |
| 7 | JINWOO | chennai |
| 8 | eren | Ghabaram |
| 9 | mydorical | erode |
| 10 | null | birokulum |
| Null | | |

null as assigned & show full rows

into stu-location table

MySQL - Python

[Q] Ques.

* download python with pip module

* & install mysql-python-connection in command prompt.

-> After download pip, install mysql-connector-python

[E] (Error), (Error)

so, Then, import mysql.connector connection module.

import mysql.connector as m

↳ f0 = m.connect("host='localhost', user=''",
connection object
password = "", database = "",
optional

& Then,

establish cursor-object

c = f0.cursor()

cursor object

* execute():-

<cursor object>, execute("query")

ex:-
"tooy":> import mysql.connector as m

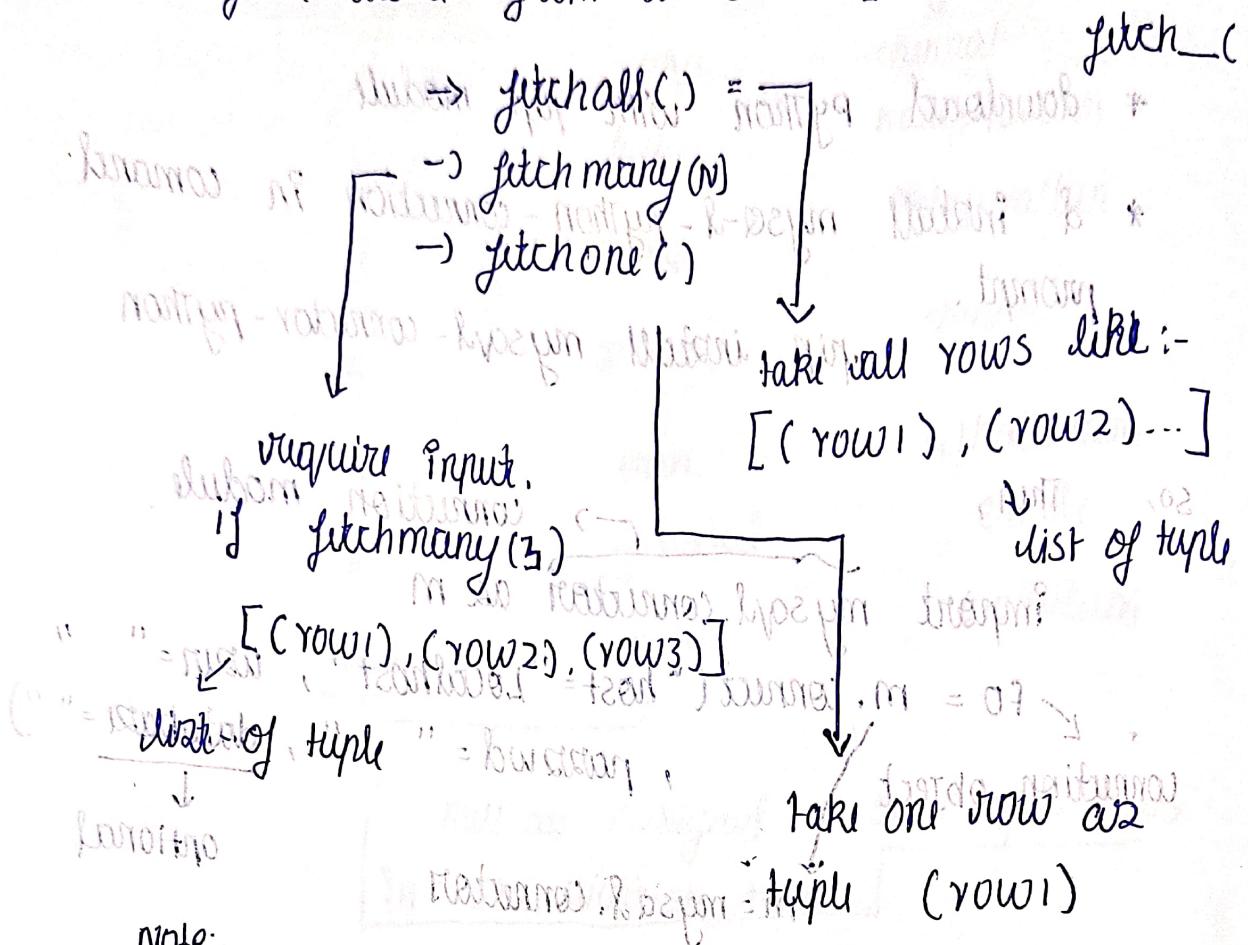

(-, <f0>= m.connect(...))

"tooy":> c = <f0.cursor()

for row in c.execute("select * from anime"):
print(row)

Final Output

* To fetch data from cursor: [cursor object].

Note:-

If c. fetchone()
→ take 1st row
So,
c. fetchone() → number of = 1
→ second time it will 2nd row
Same for fetchmany()

Ex:- Import mysql.connector as m
f0 = m.connect(host="localhost", user="root",
password="123",)
o = f0.cursor()
o.execute("use db")
o.execute("select * from student;")
data = o.fetchall()
→ [(r1), (r2) ...]
If db not specified

0. execute ["select name, marks from studentz;"]
 data 2 = 0. fetch many(2) } = 1st two rows
 data 3 = 0. fetch many(2) } = 2nd two rows
 0. execute ["select age, name from studentz;"]
 data 4 = 0. fetch one() } = 1st row
 data 5 = 0. fetch one() } = 2nd row

"How tuple mostly don't have concept to print the info's
 ((PP. print) is not available here)

[fo. close()] -> here our the ref] -> it shows
 close SQL of connection

NOTE:-

[rows = c. rowCount] total no. of

values { } = return value fo save_rows(count) from

((!has('row'))) is not for sp { } cursor(c) to rows]

* For command like insert, alter, update [manipulation]
commands needs commit() before close()

<connection_object>.commit()

<connection_object>.close()

((pp=d pp=a) cannot . i. {d} = null

example:

c. execute ("update animu set name='goku' where a-n='obs';")

fo ← l.commit()

→ makes changes in mysql

fo ← l.close()

file. if commit()

not given → NO changes occur

* Old-style & new-style format giving

error out { } (&) print statements

error out { } (&) print statements

→ old-style = %(format)

↳ new-style = %.format()

example: c1) error out { } print statements

error out { } print statements

c. execute "select * from students where name=%s"

and marks = %s, %('lok1', 99)

note:- [for int no need string quotes]

example :- (2)

to run lot of

for loop, if = error

c. execute ("update students set marks = {} where

name = {} ; ".format(100, 'lok1'))

Note:- [for int no need string quotes]

also,

c. execute ("update students set marks = {} where
name = '{}'; ".format(a=99, b=99))

("data = str. a & b assign it self")

a = 99, b = 99 ("").format(a=99, b=99))

↳ error in print statement

(1 format if null) (use a .)

thus output on printing for
